Under the Guidance of

Trainer Name

Technical Trainer

Technical Department, KG College of Arts and Science

Academic Year: **2025 – 2026**

APRIL 2026

Semester: **II**

DECLARATION

I hereby declare that the project entitled **"SEMESTE GPA AND CGPA"** submitted in partial fulfillment of the requirements for the course [**Java Programming]** is a **record of my original work** carried out under the guidance of **[Trainer Name]**, Technical Trainer, Technical Department, KG College of Arts and Science.

I further declare that this project has not been submitted previously, either in part or in full, for the award of any degree, diploma, or other similar title, at this or any other institution.

I have acknowledged all sources of information used in this project wherever applicable.

April 2026

Coimbatore

ABSTRACT

The Semester GPA and CGPA Calculator is a Java-based application developed to simplify the process of calculating academic performance metrics for students. The system allows users to input subject grades and corresponding credit hours for each semester, and it computes the Grade Point Average (GPA) for a specific semester as well as the Cumulative Grade Point Average (CGPA) across multiple semesters.

The application is designed with a user-friendly interface and follows standard GPA calculation formulas to ensure accuracy and consistency. It reduces manual errors and saves time compared to traditional calculation methods. The program demonstrates the use of core Java concepts such as classes, methods, loops, arrays, and user input handling.

This project is useful for students and educational institutions to efficiently track academic progress and performance over time. It also serves as a practical example of applying programming skills to solve real-world problems in the academic domain.

1. INTRODUCTION

The Semester GPA and CGPA Calculator is a Java-based application designed to assist students in evaluating their academic performance efficiently. In many educational institutions, calculating GPA and CGPA manually can be time-consuming and prone to errors. This project automates the process by allowing users to input grades and credit values, and then accurately computes the results.

The system is developed using core Java programming concepts and provides a simple and interactive way for students to monitor their progress. It serves as a practical tool for both academic use and learning programming fundamentals.

1.1 Objective

To develop a Java application for calculating Semester GPA and overall CGPA.

- To reduce manual calculation errors and improve accuracy.
- To provide a simple and user-friendly interface for users.
- To apply core Java concepts such as arrays, loops, and functions in a real-world application.
- To help students track their academic performance easily.

1.2 Overview

This project focuses on creating a calculator that computes GPA for a single semester and CGPA across multiple semesters. The user inputs subject grades and credit hours, and the system processes this data using predefined formulas.

The application works by converting grades into grade points, multiplying them with credit hours, and then calculating the average. For CGPA, it aggregates GPA values from multiple semesters. The system ensures accuracy and consistency while minimizing user effort.

1.3 Features

Easy input of subject grades and credit hours

- Automatic calculation of Semester GPA
- Calculation of overall CGPA across semesters
- Simple and user-friendly interface
- Error reduction compared to manual calculations
- Fast and efficient processing
- Can handle multiple subjects and semesters

2. PROGRAM ANALYSIS

The Semester GPA and CGPA Calculator program is designed to analyze student academic data and produce accurate results based on input values. The program takes subject grades and corresponding credit hours as input, converts grades into grade points, and performs calculations using standard GPA formulas.

The analysis involves validating user inputs, ensuring correct grade-point mapping, and applying mathematical operations such as multiplication and averaging. The program uses control structures like loops and conditional statements to process multiple subjects and semesters efficiently. Overall, the system ensures reliability, accuracy, and ease of use.

2.1 Problem Definition

In educational institutions, students often need to calculate their GPA and CGPA to assess their academic performance. Manual calculation can be complex, time-consuming, and prone to errors, especially when dealing with multiple subjects and semesters.

The problem is to develop a system that automates the calculation process, reduces errors, and provides quick and accurate results. The solution should be simple, efficient, and accessible to users without requiring advanced technical knowledge.

2.2 Project Overview

The Semester GPA and CGPA Calculator is a Java-based application that simplifies academic performance evaluation. It allows users to input grades and credit hours for each subject and calculates the GPA for a semester as well as the CGPA across multiple semesters.

The project is built using basic Java programming concepts such as classes, methods, arrays, and loops. It provides a structured approach to handle input, process data, and display results clearly. The application can be used by students to monitor their academic progress throughout their course.

2.3 Scopes and Limitations

Scope:

- Can be used by students in schools and colleges
- Supports calculation of GPA for individual semesters
- Calculates CGPA across multiple semesters
- Helps in tracking academic performance over time
- Can be further enhanced with graphical user interface (GUI)

Limitations:

- Works based on predefined grading systems only
- Does not support different grading policies automatically
- Limited to basic input/output (console-based program)
- Requires manual entry of grades and credits
- Does not store data permanently (no database integration)

3 . SYSTEM DESIGN

The Semester GPA and CGPA Calculator is designed using a simple and modular approach to ensure clarity and ease of implementation. The system follows a structured flow where the user provides input, the program processes the data, and the results are displayed.

The design consists of three main components:

1. **Input Design**
   The system accepts user inputs such as number of subjects, grades, and credit hours. Input validation is considered to ensure correct data entry.
2. **Processing Design**
   The program converts grades into grade points and calculates GPA using the formula:
   GPA = (Sum of (Grade Point × Credit)) / Total Credits
   For CGPA, it averages the GPA values of multiple semesters.
3. **Output Design**
   The calculated GPA and CGPA are displayed clearly to the user. The output is formatted for easy understanding.

The system is implemented using Java concepts such as classes, methods, loops, arrays, and conditional statements. The design ensures that the program is simple, efficient, and maintainable.

3.1 Modules

The project is divided into smaller functional units (modules) for better organization and readability:

1. **Main Module**
   - ➉ Controls the overall flow of the program
   - ➉ Displays menu options
   - ➉ Calls appropriate functions for GPA and CGPA calculation
2. **Input Module**
   - ➉ Handles user input for number of subjects, grades, and credits
   - ➉ Stores input values in arrays or variables
3. **Grade Conversion Module**
   - ➉ Converts letter grades (A, B, C, etc.) into corresponding grade points
   - ➉ Uses conditional statements or switch cases
4. **GPA Calculation Module**
   - ➉ Calculates Semester GPA using grade points and credit values
   - ➉ Performs multiplication and averaging operations
5. **CGPA Calculation Module**
   - ➉ Calculates overall CGPA based on multiple semester GPAs
   - ➉ Maintains cumulative results
6. **Output Module**
   - ➉ Displays calculated GPA and CGPA
   - ➉ Ensures results are presented clearly and neatly

4.METHODOLOGY

The methodology followed in this project is a step-by-step approach to design and develop the Semester GPA and CGPA Calculator. First, the problem is identified and analyzed. Then, the system is designed by dividing it into modules such as input, processing, and output. After designing, the program is developed using Java programming concepts. The developed system is tested with various inputs to ensure accuracy. Finally, the results are documented for evaluation and future improvements.

4.1. Problem Analysis

The main problem is the difficulty in manually calculating GPA and CGPA, which involves multiple subjects, grades, and credit hours. Manual methods can lead to calculation errors and consume time. Therefore, a system is required to automate this process, ensuring accuracy, speed, and ease of use for students.

4.2. System Design

The system is designed using a modular structure:

- Input module to collect grades and credits
- Processing module to calculate GPA and CGPA
- Output module to display results

The design ensures smooth data flow from input to output and uses simple Java constructs like loops, arrays, and functions for implementation.

4.3. Program Development

The program is developed using Java programming language. It uses:

- Arrays to store grades and credits
- Loops to process multiple subjects
- Conditional statements for grade-to-point conversion
- Methods to organize the code into reusable blocks

The development focuses on simplicity, readability, and efficiency.

4.4. Testing and Validation

The program is tested with different sets of inputs to verify correctness. Test cases include:

- ❿ Different numbers of subjects
- ❿ Various grade combinations
- ❿ Edge cases like minimum and maximum values

The output results are compared with manual calculations to ensure accuracy. Errors found during testing are corrected to improve reliability.

4.5. Result and Documentation

The final program successfully calculates Semester GPA and overall CGPA accurately. The results are displayed clearly to the user. Documentation includes details of design, implementation, testing, and results, making it easy to understand and maintain the project.

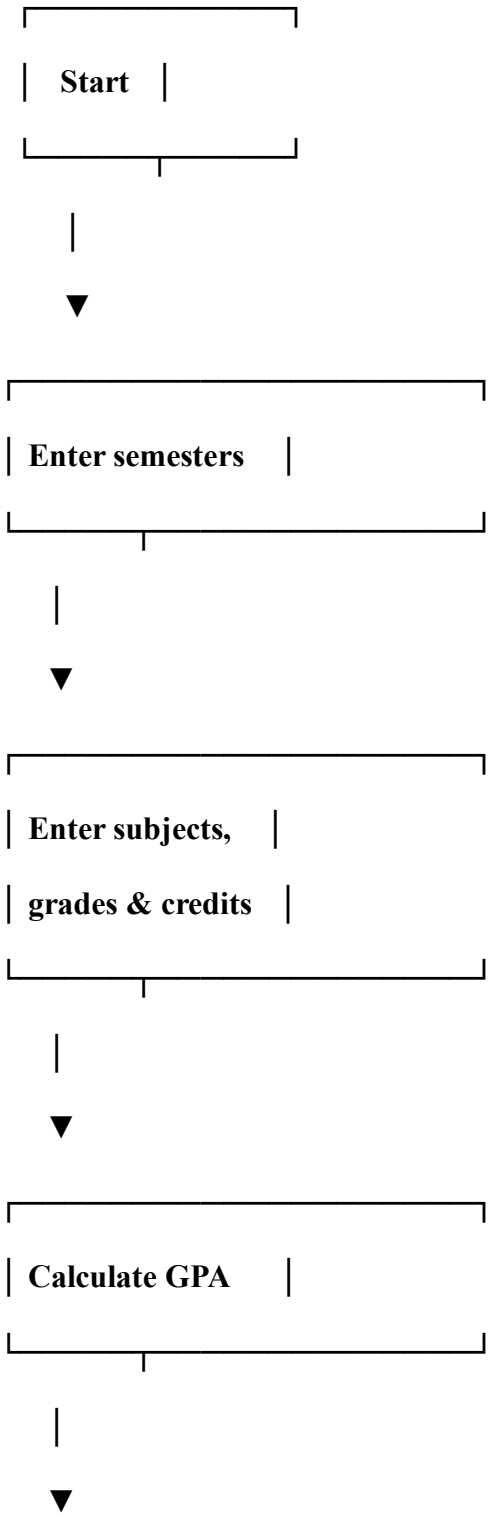

4.6. Algorithm

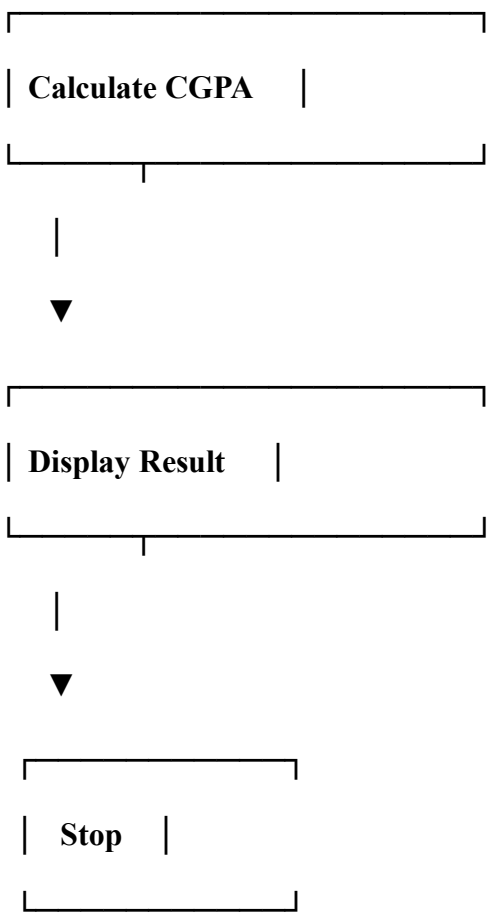

Start

1. Input number of subjects
2. Initialize total grade points and total credits to 0
3. For each subject:
    - ❿ Input grade and credit
    - ❿ Convert grade to grade point
    - ❿ Multiply grade point by credit
    - ❿ Add to total grade points
    - ❿ Add credit to total credits
4. Calculate GPA = Total Grade Points / Total Credits
5. Repeat steps for multiple semesters (for CGPA)

6. Calculate CGPA = Sum of GPA / Number of semesters
7. Display GPA and CGPA
8. Stop

4.7. Flowchart

5.SOURCE CODE

```
import java.util.Scanner;
public class SGPAandCGPACalculation{
        public static void main(String[] args){
                Scanner sc=new Scanner(System.in);
                System.out.print("ENter number of Subjects:");
                int n=sc.nextInt();
```

```
        double totalCredits=0,totalPoints=0;
        for(int i=1;i<=n;i++){
                System.out.println("Subject"+i);
                System.out.print("Enter the Credit:");
                int credit=sc.nextInt();
                System.out.print("Enter the Grade Point:");
                int grade =sc.nextInt();
                totalCredits+=credit;
                totalPoints+=credit*grade;
        }

        double sgpa=totalPoints/totalCredits;
        System.out.println("SGPA="+sgpa);

        System.out.println("Enter Number of Semester:");
        int sem=sc.nextInt();
        double totalSGPA=0;
        for(int i=1;i<=sem;i++){
                System.out.print("Enter SGPA of semester"+i+":");
                totalSGPA+=sc.nextDouble();
        }

        double cgpa=totalSGPA/sem;
        System.out.println("CGPA="+cgpa);

        sc.close();
}
```

}

6.INPUT AND OUTPUT SCREENS

Input Screen

Enter number of Subjects: 3

Subject 1

Enter the Credit: 3

Enter the Grade Point: 9

Subject 2

Enter the Credit: 4

Enter the Grade Point: 8

Subject 3

Enter the Credit: 2

Enter the Grade Point: 7

Enter Number of Semester: 2

Enter SGPA of semester 1: 8.5

Enter SGPA of semester 2: 8.0

Output Screen

SGPA = 8.11

CGPA = 8.25

7.DISCUSSION & CONCLUSION

7.1 Discussion

The Semester GPA and CGPA Calculator was developed to simplify and automate the process of calculating academic performance. The program effectively takes user inputs such as subject credits and grade points, processes them using standard formulas, and produces accurate SGPA and CGPA values.

During development, it was observed that using loops and simple arithmetic operations made the program efficient and easy to understand. The modular approach helped in organizing the code and improving readability. Testing with different input values confirmed that the system produces reliable results.

However, the program is console-based and requires manual data entry, which may not be convenient for all users. It also assumes a fixed grading system and does not include advanced features like data storage or graphical interface.

7.2 Conclusion

The project successfully achieves its objective of calculating Semester GPA and CGPA using Java. It reduces manual effort, minimizes errors, and provides quick and accurate results. The application demonstrates the practical use of programming concepts such as loops, arrays, and user input handling.

Overall, the system is simple, efficient, and useful for students to track their academic performance. With further enhancements like a graphical user interface and database integration, the project can be made more user-friendly and scalable for real-world applications.
